MAIN EXAMINATION

JANUARY – APRIL 2015 TRIMESTER

FACULTY OF SCIENCE

DEPARTMENT OF MATHEMATICS AND COMPUTER SCIENCE

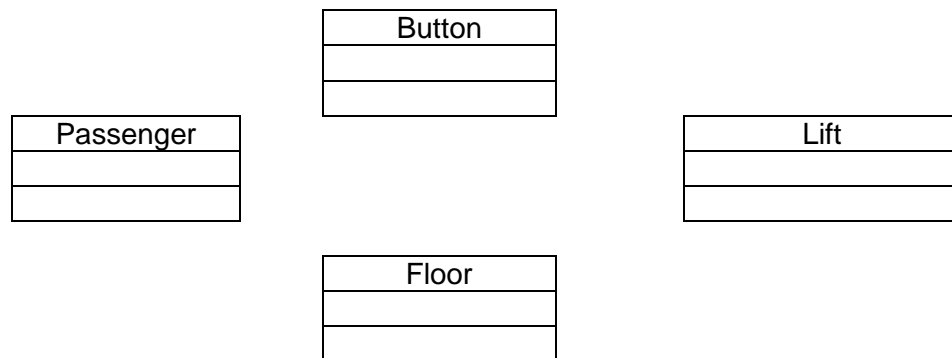

REGULAR PROGRAMME

CMT 310: OBJECT ORIENTED ANALYSIS AND DESIGN

Date: APRIL 2015 **Duration: 2 Hours**

Instructions: Answer Question ONE and any other TWO Questions.

- Q1. a) State the importance of models in systems development. **(2 marks)**
- b) Describe the following objects in terms of their attributes and operations:
Student and lecturer. **(4 marks)**
- c) Consider a lift system serving a tall building with a number of floors. It we model the system with representative classes, draw the class diagram, showing relationship and multiplicity for the following classes: **(4 marks)**

- d) At the beginning of each semester, students may request a course catalogue containing a list of courses offerings for the semester. In addition course catalogue include information such as professor, department and pre-requisites. The new system will allow students to

select four course offerings for the coming semester. In addition, each student will indicate two alternative choices. No course offering will have more than ten students or fewer than three students. The system will cancel the course with fewer than three students.

After the registration process, the registration system sends information to the billing system. The billing system will bill the student for the semester. The system will allow professors to indicate the teaching course and to see the students signed up for the courses.

For each semester, students can change the schedule during a period of time. Students will access the system during this time to add or drop course(s).

- i) Identify the actors that will simulate this system. **(2 marks)**
- ii) Draw a use case diagram for the above system. **(8 marks)**
- iii) Assuming one to the use case is "Request Course Catalogue" write the scenario inform of a UML Sequence diagram. **(5 marks)**

- Q2. a) Marist University would like to start a Marist University Car Rental Information System for its staff members for several academic related trips during the year. The problem domain is and Information system for the Marist Car Rental Centre.

The following are the details and assumptions of the same;

- It is a stand- alone centre, not part of a large organization.
- Rents only cars, not any other vehicle or items
- A "car" can be in any capacity; 4-wheel, saloons and so on.
- The rental charge may vary by capacity E.g. Hummer rentals are more expensive that Toyotas
- The centre does not sell anything
- All transactions are rentals
- The input medium by which membership and car rentals are captured is not important
- Cash-only payments
- On completion of a rental, the customer receives a transaction report with "typical" information
- Each renter has a separate membership.

- i) Identify at least FOUR primary use-cases and related actors. Draw the results in a UML use case diagram for a Car Rental Information System. **(4 marks)**

ii) Bounded by the Rent Cars use-case diagram in Question 2(i) above, create a partial domain model and illustrate it in Uml notation format showing the concepts, associations and attributes where applicable. **(12 marks)**

iii) Bounded by the Rent Cars Use-case diagram in Question 2(i) above create a System Sequence Diagram (SSD) in the UML notation. Show actors and system events. **(4 marks)**

- Q3. a) Consider the following tasks performed by a staff in a pet shop;
- addNewItem(): A staff member creates a new item's record for the item by specifying information about the item.
 - deleteItem(): A staff member deletes an existing Item's record.
 - checkItem (): A staff member checks an existing item's record.
 - updateItem(): A staff member orders a certain amount of a particular item.
 - handlerPurchase(): A staff member handles the purchase for a customer. This action involves:
 - checkItem(): checks the item's amount & price
 - updatedItem(): updates the item's amount remaining in store.

In the case that a requested item is unavailable, the staff may perform;

- orderItem(): order a particular item to restock.

Required: Draw two equivalent interaction(sequence and collaboration) diagrams to represent the scenario as per tasks performed by the member of staff in the pet shop. **(20 marks)**

- Q4. a) What is the difference between object oriented analysis and object oriented design? **(3 marks)**
- b) Highlight TWO fundamental differences between object oriented analysis and design (OOAD) and Structured Analysis and Design. **(2 marks)**
- c) Briefly discuss the impact that object-oriented analysis and design techniques have had on each of the following aspects of software engineering, clearly justifying your position/view:
- i) Maintainability and Resilience. **(2 marks)**
 - ii) Correctness and Robustness **(2 marks)**
- d) Using a well-labeled diagram, illustrate the components of a Uml class diagram using any data of your choice (MUST have at least THREE classes) **(6 marks)**

- e) Outline FIVE basic steps/activities that one would normally follow in carrying out an object oriented analysis of a medium-sized software project.

(5 marks)

- Q5. a) Lightwing Ltd, a small airline charter company based in Wilson Airport Nairobi, wishes to build a new ticket reservation system. Their IT manager is impressed with what he has heard about object oriented analysis and design techniques.

They have hired you, an experienced system analyst in OO technology to carry out a detailed analysis of the new system. The IT manager has supplied you with a detailed Terms of reference document listing the following requirements for the proposed system.

- Should have an online (web) interface to allow prospective customers to register and once registered, be able to get quotations based on their travel details, select and pay for tickets and reschedule (within certain limits) their flights.
- Should have an online (web) administration interface to allow an administrator to login, view various reports on available flights, reservations, rescheduled flights, full flights and waiting lists.
- Should be able to send email and SMS (Short Message Service) alerts to relevant company staff (administrators) on full flights and cancelled or delayed flights.

You are required to develop a first-cut analysis as well as initial design for the above airline reservation system using object oriented Analysis and Design with UML (Unified Modeling Language) while noting the above footnotes:

Specifically:

- i) Draw a UML case Diagram for the main use cases of the proposed system. **(6 marks)**
- ii) Draw a well-labeled sequence Diagram to illustrate the order of events/messages when a user is making a reservation from requesting for a quotation to making payment. **(6 marks)**
- iii) Construct a subset of a detailed UML class diagram illustrating design details to potentially implement two possible objects: Customer and reservation. **(6 marks)**
- iv) Outline TWO advantages of object oriented Design that the IT manager may have had in mind. **(2 marks)**

END
